The Reported Environment Where Objects Were Witnessed In 1983

Rural	2	Urban	1
-------	---	-------	---

Sightings by the number of witnesses (As represented by the graph opposite)

This demonstrates that as in most years, over half of reported sightings are of a single-witness event, which can tend to be of low reliability for analytical purposes. It is encouraging that over 10% of all reports are reported as multiple witness cases.

Sightings throughout the days of the week (As represented graphically opposite)

Since the vast majority of witnessed events occur in the evenings, it is odd that the trend for relatively few events to be witnessed at weekends continues. Another curiosity is that during the 'working' week, fewer reports come in for Thursdays, as was the case for the 1982 reports.

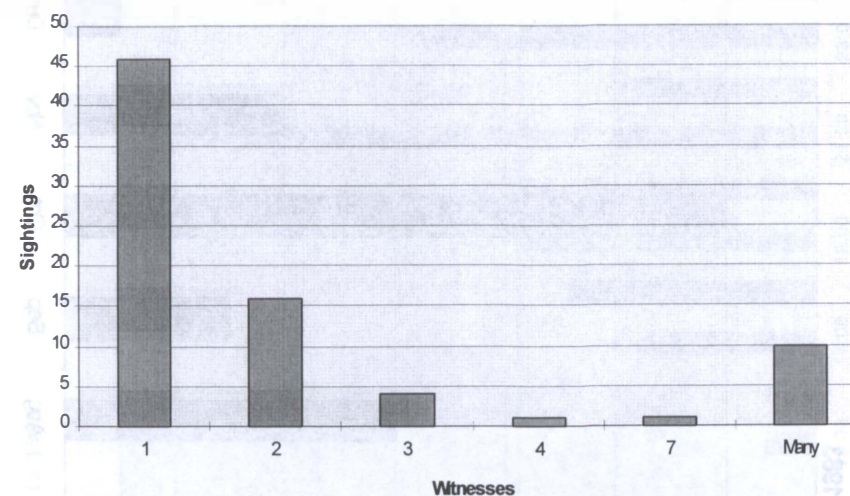

The distribution of sightings by the months of the year (As represented on page 6)

We see that in common with most years, there are surprisingly few reported sightings during the summer months, when one might think that more people would be outside on warm summer evenings, and therefore glancing at the skies. Another odd statistic is the vast difference between reported sightings for December and January, both winter months. Indeed if we look back at the breakdown for the last Register year 1982 - there were only 4 reports for December 1982, yet we then had 12 for January 1983. Can this conceivably be explained by people being otherwise engaged indoors at parties and family get-togethers in the run-up to Christmas?

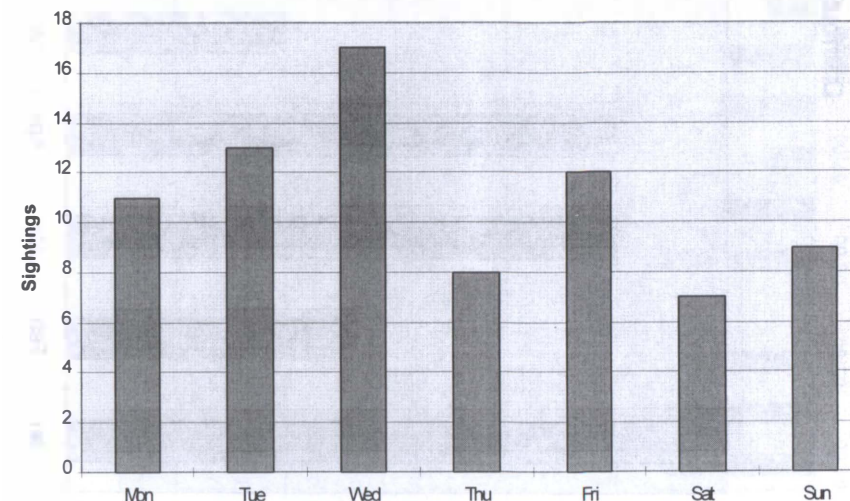

The distribution of reported sightings during the hours of the day (As represented on page 7)

While for this year we do have a better spread of sightings throughout the day generally, the vast majority are reported during the evening and early night. Logically, since most UFOs reported are of bright lights, then this apparent disproportionate number of sightings for a period of the day is brought into context.
